THE AGU SMART ON-BODY TEMPERATURE INDICATOR

- 
 remote temperature control 24 hours a day
- 
 temperature monitoring every 4 seconds
- 
 notifications of temperature changes
- 
 viewing temperature changes dynamics

Fever is an abnormally high body temperature that usually occurs during an infection, inflammation, or some other kind of malady. Fever is not a disease in itself but it is one of the most common signs of illness, especially among children.

The **AGU Smart On-Body Temperature Indicator** can monitor the child's temperature continuously and accurately. It provides push notifications if the temperature change is fast or it goes too high. You are in control of the situation at any time of the day or night without disturbing the baby, as well, you will be saving your own energy to support him/her during this uneasy time. The thermometer is fixed with a special stiker and it is firmly, but gently, attached to the baby's body without creating any discomfort.

The simple and user-friendly **AGU App** offers a wide range of services (monitoring for several kids, temperature graph displays, a full scale portrait of the child's health) and accumulates data into its history.

This is also a great tool for doctors to understand the dynamics of the sickness better.
